

Technical Design - Market/Channel Picker Enhancements and Proposal Use

Functional Use of the Component

As part of the feature for Proposal Creation there is a need to assign included markets (both aggregate and/or sub markets) and channels in the proposal ahead of use in other components, such as spot selection, split creation, optimisation, etc. As part of this there is the intention to use the same station/channel picker as is available in the Agreements feature. The component should allow the user to do the following:

- Navigate and view the markets available based on the Sales Allocation of the proposal, that is Metro or Regional
- Present all available markets to that Sales allocation - for regional users that is both Aggregate markets and the sub markets that live within
- Allow the user to select or deselect individual channels within aggregate and sub markets.

The Stations/Channels need to be related to the Proposal record created for the Media Plan as child records to allow ease of access later when being used as filter presets for later components.

Data Model

The Linear Parameters object is being used to store all inputs related to the Proposal, and the records for Markets/Channels will need to be saved to these records as follows:

Proposal ID	Type	Inclusion Type	MediaChannel	External Identifier
recordId	Market	Inclusion	FROM BRIEF	FROM BRIEF
recordId	Channel	Inclusion	FROM BRIEF	FROM BRIEF

To allow for these changes, ensure this object has available a MediaChannel object lookup and Type picklists of Market and Channel available.

Data Sources

Markets and channels are sourced from the Market API. The retrieval of markets and channels should match the patterns defined for Agreement creation. These currently live in the Media Channel (Brand) object and an instance of the Media Channel and potentially a copy of the External Identifier will need to be copied to the Linear Proposal records created for this feature.

Save Behaviour - SF and OMS

The expectation is that the “save” of this component is conducted as a result of a call to action - that is, either the selection of a “Save and close” action on the screen or navigation to another available page. Ensure that save of these values occurs as part of a reusable component that can be called within other navigation actions.

It is worth noting that there are no validations required on save for this feature.

Navigation Behaviour

Users should be prevented from navigating to the Optimiser Inputs page without selection of at least one market and one channel, but no other preventions should exist.

Reusable Components

- The agreement function already retrieves markets and channels with the correct filter set. Reuse this class to retrieve the markets/channels if possible and pass into the filter the Metro/Regional selection that the page already contains
- The station/channel picker should already be defined for the Agreement component - this can be reused as well with the removal of the agreement-specific elements like bonuses and discounts.

What will likely need to be developed for this feature is a class to commit the saved values to Linear Parameter records.

User Stories featuring this Component

The changes to the Station/Channel picker, as well as the use of the Station/Channel picker are tested as part of the following user stories:

- [PROP-760: \[SF\] Select Agg/Sub Markets and Channels in Agreement](#) Ready for Review
- [PROP-958: \[SF\] Select Markets and Channels in Proposal Builder](#) Prioritised

To be Completed:

- ☐ Confirm Acceptance Criteria @Sailesh Vempaty @Joanna Damianakis
- ☐ Written solution documentation for data model save @Joanna Damianakis
- ☐ Written detailed design of apex classes @Paulo Cuenca
- ☐ Written detailed design of LWCs @Paulo Cuenca
- ☒ Confirmation of source of Program and Channel data
